TUTORIAL 3

1. Start up Android Studio and open an existing project (e.g. Hello World) or create a new one (using appropriate values for package name, minimum SDK version and default activity.

2. Open the layout file for your MainActivity (or any other activity in your project).

   Project > app > res > MainActivity.xml

3. Switch to the XML (Text) view and examine the code.

4. Use the Layout Editor to create a non-trivial user interface: add new layouts and components, and configure them in the *Properties* window. As you go along, switch between graphical and XML view to examine visual layout and code.
   - Where lie the strengths of each method?
   - Can the generated code be optimised?

5. Create variations of your non-trivial layout for extra-large screens, landscape formats and extra-high density screens.

   Related Link: https://developer.android.com/guide/practices/screens_support.html

6. (Optional) Write an app which only has one button. If the button (labeled as 'Click me!') is clicked, the text 'Hello World!' will be printed below the button.
   Can you use the println() function to print the text?
   Test your app on either the AVD or your own mobile phone.
   We shall sort it out next week in the lecture.
